

EDI Messages Solution

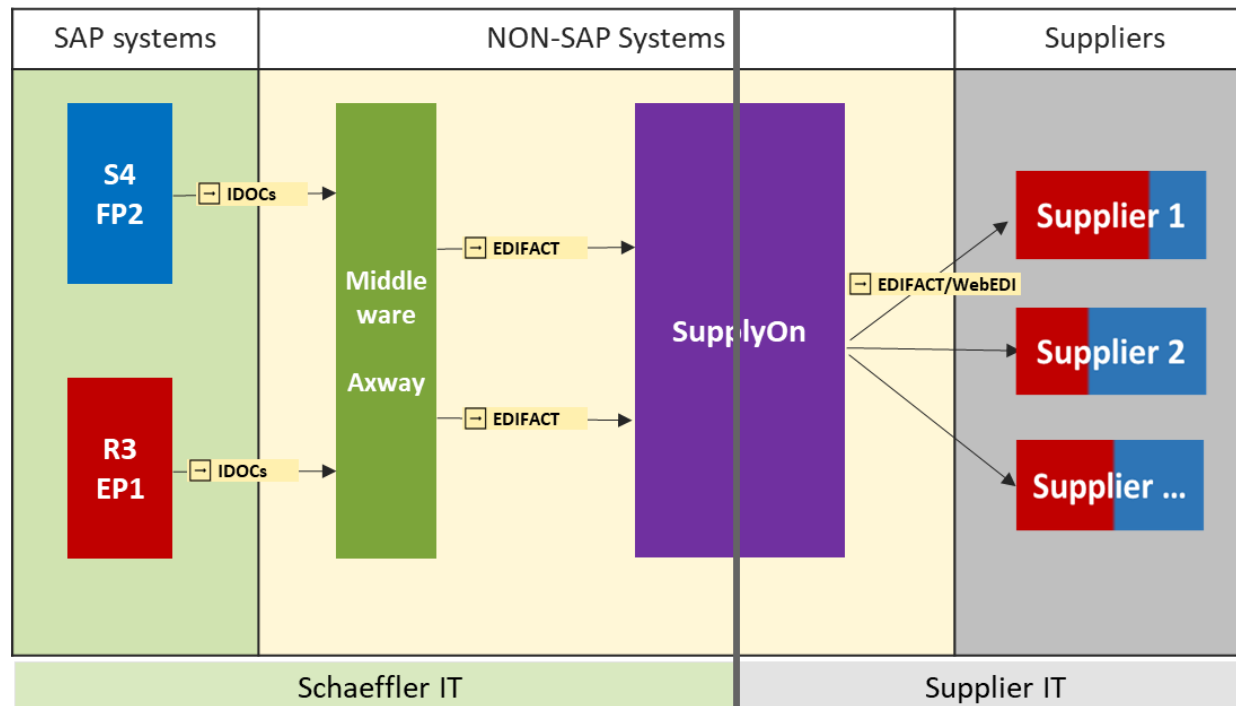

EDI messages - overview of the new situation

After go-live, pilot plants will start sending EDI messages from S4, while other Schaeffler plants continue sending them from R3. Data from both systems (business partner, material master, units of measures, etc.) will be sent to suppliers without conversion: for the same product supplier receives different data from different plants.

EDI messages - overview of the new situation

Important! Only for EDI suppliers:

Suppliers need to make changes in their ERP systems (for example create a new customer) to process the data sent by Schaeffler from two different systems. EDI messages use master data from the system (S4 or R3), from which it was sent. The choice of the solution to be able to process these two types of data is on supplier's side.
